

Presentation  
Advanced Information Retrieval [706.705] - Jan 2023

# A true news recommender an TF-IDF variation and Topic Modelling

Group 16

**Responsibilities:** Research, Idea, implementation,  
Running the project (GPU/CPU)

- Csongor Hegedüs
- Mario Lukas Mauberger
- Roman Lukas Prunč
- Suraj Yathinatti

**Repository link:** <https://github.com/mariomauberger/fakeNewsClassification/>

# Aim

Based on 1 news article

Suggest 5 additional articles

Covering the same or the most similar topic

Which are true and not fake news

# Table of Contents

- Dataset
- Exploratory Data Analysis
- Data Cleaning
- Baseline Model
- Class relevant TF-IDF
- Topic Modelling with BERTopic
- BERT-Plus Model
- Evaluation
- Conclusion

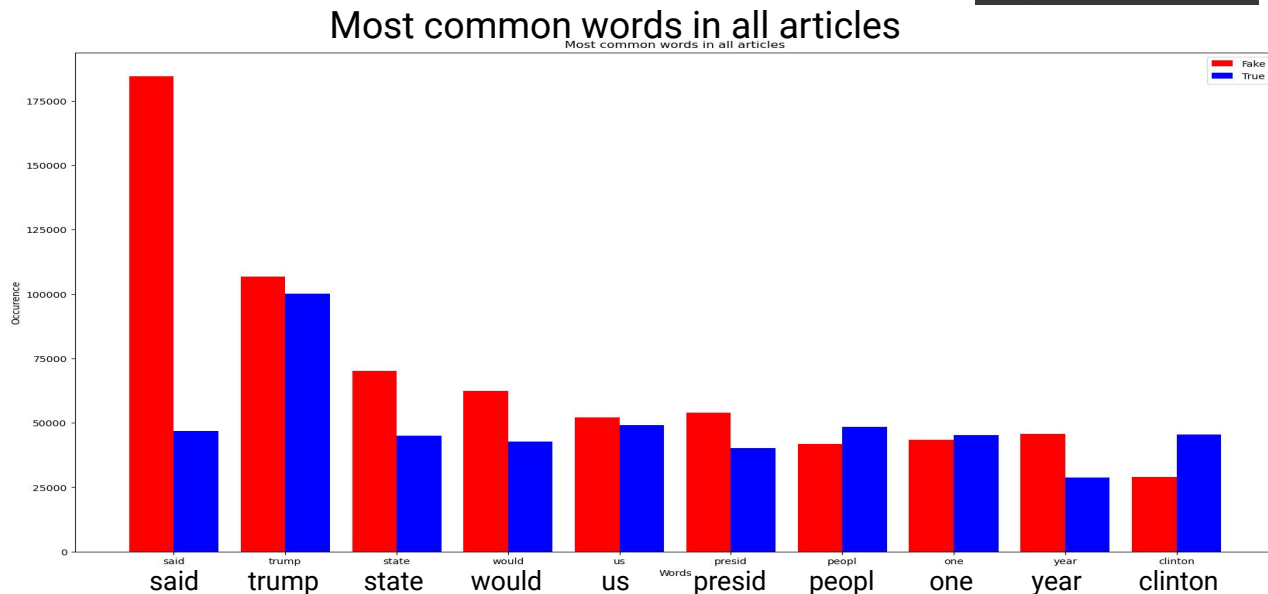

# Dataset

- Dataset:  
**WELFake - Dataset**  
<https://www.kaggle.com/datasets/saurabhshahane/fake-news-classification/versions/35?resource=download>
- **Title**, **Text**, and **Label** are the three main columns.
- **72134** distinct values
- **Label** can be either 0 or 1- indicating if the news is fake or true.

# Exploratory Data Analysis

- Balance between false and real news - slightly more tn.
- Word count after preprocessing steps (Punctuation and stop word removal, stemming)

```
Unnamed: 0    72134
title         62348
text          62719
label           2
dtype: int64
```

# Words with the largest absolute difference between true and false news

## Words with largest absolute frequency between tn and fn

## Words with biggest df difference between tn and fn

# Splitting the data

- **Training-test data split: 80%-20%**
- **Training data: 57707 documents**
- **Test Data: 14427 documents**

# Baseline Model

- Simple **TF-IDF**
- **Naive Bayes Classifier**
- Fake news **detection accuracy - 87%**
- Used for article recommendation - **MAP@k = 51%**

# CLASS RELEVANT TF-IDF

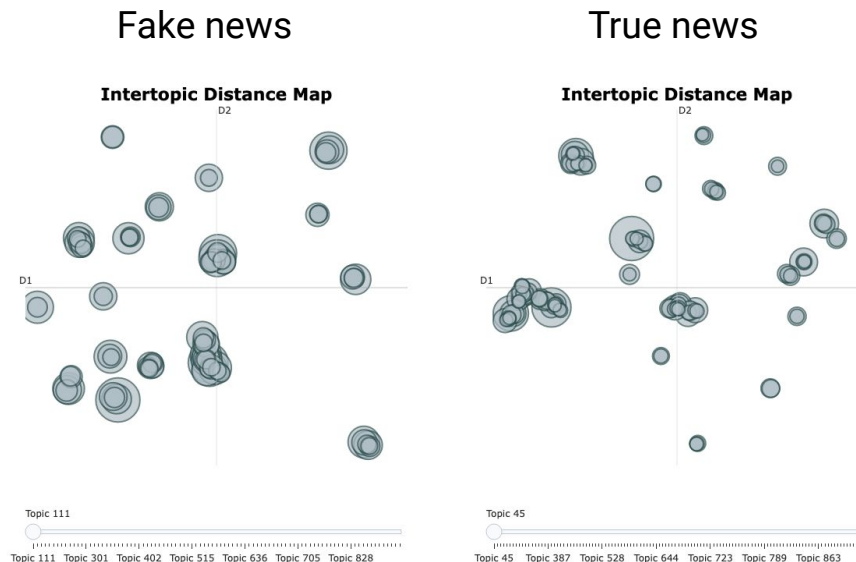

- Identifying **overrepresented words** in one news category
- Based on training data
- **IDF** for each term in a document - but only **considering opposite class**  
E.g. 1 tn document regarded against all fn documents
- For terms in **more than 10 documents** in respective category
- Considered if **difference** between tn IDF and fn IDF **0.5 or larger**
- Then **weighted** with simple **TF**

# Topic Modelling with BERTopic

- Identified **911 topics** - **18343 documents** in “garbage topic”

- 91 topics only in fn** (2173 training documents)

- 116 topics only in tn** (2510 training documents)

**Note:** Due to time and computational limitations, we had to eliminate the initial implementation that used sentiment scores to distinguish between fake news and true news within the topics.

# BERT-Plus Model

- **Learning language**
  - Contextualized meaning
- **Predicting** if articles are TRUE/FAKE

## Model Layers

- **BERT** (Bidirectional Encoder Representation of Transformers) (bert-base-uncased)
  - MLM (Masked language modeling)
  - NSP (Next sentence prediction)
- **Linear Layer** incorporates the **Topics**

```
class BertPlusModel(torch.nn.Module):  
    def __init__(self, bert_model):  
        super(BertPlusModel, self).__init__()  
        self.bert_model = bert_model  
        self.dropout = torch.nn.Dropout(p=0.2)  
        self.linear = torch.nn.Linear(769, 1)
```

# BERT-Plus model performance

	Training loss	Test accuracy
<b>Without</b> garbage-category:  (57k training data) (14k test data)	Epoch 1: 0.0064 Epoch 2: 0.0014 Epoch 3: 0.0008 Epoch 4: 0.0005 Epoch 5: 0.0003	96.36%
<b>Including</b> garbage-category:  (39k training data) ( 8k test data)	Epoch 1: 0.0091 Epoch 2: 0.0020 Epoch 3: 0.0010 Epoch 4: 0.0005 Epoch 5: 0.0004	97.08%

# Recommendations

- **Query**

- Random article

- **Output**

- Top 5 articles
  - same (or most similar) topic(s)
  - TRUE news.

- Within one topic

- Evaluate whether articles **true or false**
- Rank tn based on **tf-idf**
- Return in that order - until 5 recommended

- If **less than 5 articles** found - add new ones from **next topic**

# Evaluation/Results

	Fake news detection	Mean average precision @k
Baseline model	87.00%	51.00%
BERT-Plus model	97.08%	92.70%

MAP@k tested for the BERT-Plus model on 1000 articles from the test data.  
Larger datasets crashed our kernels.

# Conclusion

- **Improved fake news detection**
  - ~10%
- **Improved recommendations (map@k)**
  - ~41%
- **Good dataset for training our model**
  - 95 % accuracy with 20k train data
  - 97 % accuracy with 57k train data
  - Garbage category did not have a big influence on the accuracy
- **Good results but computationally expensive**

## And our struggles 😊

```
Collecting package metadata (current_repodata.json): done  
Solving environment: failed with initial frozen solve. Retrying with  
flexible solve.  
Solving environment: failed with repodata from current_repodata.json  
, will retry with next repodata source.  
Collecting package metadata (repodata.json): done  
Solving environment: \ █
```

`OutOfMemoryError: CUDA out of memory. Tried to allocate 14.00 MiB (GPU 0; 8.00 GiB total capacity; 7.14 GiB already allocated; 0 bytes free; 7.27 GiB reserved in total by PyTorch) If reserved memory is >> allocated memory try setting max_split_size_mb to avoid fragmentation. See documentation for Memory Management and PYTORCH_CUDA_ALLOC_CONF`

Dead kernel

**Your notebook tried to allocate more memory than is available. It has restarted.**

- This IS expected if you are initializing a BertModel from the checkpoint of a model trained on another task or with another architecture.
- This IS NOT expected if you are initializing a BertModel from the checkpoint of a model that you expect to be exactly identical (initializing a BertForSequenceClassification model from a BertForSequenceClassification model).

Time taken: 18.96216654777527

```
[ ]: start = time.time()  
      model.train()
```

### Kernel Restarting

The kernel appears to have died. It will restart automatically.

OK
